Product Applications

The Carten HBA1000 series is a pneumatically actuated bellows valve designed for bulk gas distribution in high purity gas and solvent systems where large flows are required to support user demands in the facility. The Carten design HBA1000 pneumatic actuated valve model is suitable for insert gases, most toxic gases and most solvents delivering performance, containment and cleanliness for the process media. The unique pneumatic actuator has an innovative visual open/close indicator providing the user with a visible signal when the valve is in an opened or closed position. The unique bellows valve design enables the HBA1000 to achieve superior flows at low to medium operating pressures under a variety of system temperatures in the ever-challenging demands in high technology markets

Primary Applications Include:

- Ultra-high purity process gases
- · Ultra-high purity bulk gas delivery systems
- · Ultra-high purity solvent systems
- Automated isolation control in filter stations
- · Automated isolation control in purifier systems
- Ultra-high purity gas supply in tank farm and gas yard installations

Primary Product Features:

- · Durable bellows valve design for ultra-high purity and superior flow
- · Innovative actuator design with visual open/close indicator
- · Compact and robust actuator design to fit in high purity gas installations
- Pneumatic operation available in normally closed (NC) and normally open (NO)
- Capability to fit proximity sensors for PLC control purposes
- Broad pneumatic air supply range from 60-100 psi (4.2-6.9 bar)
- No internal particle shedding of components
- Superior leak rate of 1x10-9 scc/s Helium for diaphragm seal and PCTFE seat
- Assembled and tested in a class 10 cleanroom for cleanliness
- · Purge ports and purge valves are integral in the valve body
- · Electropolished wetted surface for superior corrosion resistance
- Individual serialisation of valves for complete quality traceability
- Capable of operating at temperatures between -30°C to +150°C **

* Carten can advise on the suitability of specific media based on the compatibility or otherwise with the materials of construction for the valve. It is the responsibility of the systems design engineer to make a selection on the suitability of valves based on their knowledge of gas design systems, the materials of construction and the specific operating conditions of the system.

^{**} Standard operating temperature for PCTFE is -30°C to 82°C. A polyimide (Vespel) seat will enable the valve to operate at a higher temperature, up to 150°C.
